Software

At its core, software is a set of computer-implemented instructions. But it's more than that. Software determines *how* we interface with computers and determines what we can make computers *do*. Societies around the world are more heavily relying on computers to do everything from running and monitoring complex transportation networks to entertaining people in their leisure time.

Advances in software are a staple to growth, efficiency, and automation. If you're running SaaS on the cloud, developing a mobile app, or improving a desktop application, software is the name of your game. Our patent practitioners servicing this technical area have academic and industry experience in computer science, software engineering, and mathematics.
